

Technical Bulletin

The use of a Paste brush with Mounting Paste

TB#: RTTNA-006-TB Rev. # 1

Rev. Date: 09/01/2009

Bead Lubrication: Proper bead lubrication is critical to tire mounting. The goal of using a bead lubricant is to temporarily reduce the friction between the rubber tire bead and the metal rim flange area of wheels. Bead lubricant allows rubber to slide against the wheel as the mounting device and/or tool are used to deflect the bead over the wheel flange area and down into the rim well until the complete tire bead is inside the rim flange area. Also supplies the needed lubrication for fast concentric bead seating.

REMA TIP TOP's Universal Mounting Paste has proven to supply excellent lubrication needed when mounting tires to wheel assemblies. This particular product will also provide:

- > Superior "Tack"
- > Reduced tire/rim slippage
- > TPMS compatibility
- > No discolor/harm to alloy, steel or polished wheels
- > Quick concentric bead seating

Application Usage: Motorcycles, passenger vehicles, trucks (off and on road) and agriculture/construction vehicles.

Paste Lubricant Applicator: Proper use of the correct lubricant applicator with "paste" style lubricates is required to ensure correct lubricity on the rubber tire bead and bead flange area of rims or wheels.

The appropriate applicator when using a Mounting Paste product is a brush as pictured below. The Paste Brush is designed to hold the paste in position permitting the technician the ability to spread easily and evenly the paste onto the rubber tire bead and adjoining metal surfaces. Utilizing the Paste Brush will make certain that the correct amount of paste is applied with minimum to no waste. The 1" Paste Brush is designed for the use with motorcycles, passenger vehicles and light trucks tires. The 2" Paste Brush is for medium to larger tires like truck, agricultural and small OTR tire sizes.
